Extended Range Prediction for Bhutan

Background

Extended Range Prediction (ERP) for Bhutan is prepared with the support from the Indian Meteorological Department (IMD), Government of India. The model used for the system is CFSv2 coupled model (Atmospheric and Ocean model) which runs once every week (Wednesday), with the 16 Ensemble Members at the horizontal resolution of around 25 km, and the products are made available the next day (Thursday). Therefore, the ERP products for Bhutan will be generated every Friday. ERP for Bhutan is carried out for two climate variables, rainfall and temperature.

Generally, the forecast output is produced on a weekly basis for a period of a month for both the variables. The current products available from NCHM are on pilot basis which needs further studies and validation with the ground observations until the product is fully operationalized.

Observed weather over last week

Most of the stations across the country showed an increase in maximum temperature during the first half of the week and decrease in minimum temperature for the last week. Light rain was observed over the country. The table below shows the observed rain and temperature data from the regional meteorological stations during last week.

Station	Parameter	13 Oct	14 Oct	15 Oct	16 Oct	17 Oct	18 Oct	19 Oct
